

Zupt Last-minute Addition to OI

Not wanting to miss out on Oceanology International in London's ExCel Centre from 13 to 15 March 2012 after all, Zupt, USA, has recently confirmed it will be exhibiting its latest technology relating to inertial metrology and ROV communications at stand no. K15.

Zupt's C-PINS can save marine construction survey project time and money. The technology has delivered more than 26 inertial metrologies and has completed sparse LBL and USBL smoothing operations in West Africa, the North Sea, the Bahamas and the U.S. Gulf of Mexico.

The Micro-TTU can solve ROV serial communication issues. Micro-TTU adds six channels to any existing RS232 channel on ROVs.
