

Network RTK Repeater Using Radio

Settop, Spain, has announced the release of the new SETTOP Repeater version. Settop Repeater allows Rover-RTK network users working in areas of low or no GSM coverage to receive differential corrections via radio. The firmware update allows the possibility to connect any external radio model from the market and connect the Settop Repeater to precision positioning systems or machine control.

Repeater field application versatility is managed by an intuitive software controlled using a touch screen. Hardware design and field applications versatility make Settop Repeater a solution for land surveying applications, marine works, control machinery and agriculture.
