

Fugro Focuses on Technology for Offshore Operations at OTC

During the OTC event in the USA, Fugro will enhance its exhibits with a series of sessions on every day of the technical programme. Offering insights into its technological solutions for marine site characterisation and asset integrity, Fugro has a team of specialists that are scheduled to share their expertise on topics including developments in AUV surveys, advances in integrated offshore geophysical methodologies and considerations for marine renewable energy facilities.

In the exhibition hall, the company's display at booth 1604 is highlighting ways to benefit from cost savings, technological advances and risk reductions, including its pioneering methodologies for hydrocarbon seep hunting during exploration campaigns. Fugro's experts will also be on hand to discuss ROCIS, its oceanographic measuring tool for protecting offshore installations from strong ocean currents.

Complementing the technical programme and exhibit booth, the poster lounge will also feature Fugro sessions on both Monday and Tuesday.

The Fugro expertise at OTC will also be accompanied by a little fun, with a selfie competition on booth 1604 providing a chance to win an exclusive Fugro Lego vessel every day. OTC is taking place from 1-4 May 2017 in Houston, TX, USA.
