IDELIX. and OSI Announce Teaming Partnership

IDELIX Software Inc. and Offshore Systems International Ltd. (OSI) have signed a teaming agreement to support the integration of Pliable Display Technology (PDT) by IDELIX into OSI command and control solutions. PDT will be used to enhance geographic situational awareness within OSI products deployed at the strategic, operational and tactical levels.

The new client/server solution combines the advanced server offerings of OSI with the advanced visualisation capabilities of IDELIX. Customers will be able to quickly access various sources of geospatial data from the OSI servers and use the PDT lens to perform continuous local resolution changes that will result in the magnification of detailed information without loss of the contextual data surroundings.
