

New Sparker for UST21

UST21, a South Korean offshore survey company, has acquired the new SIG Pulse M2. The sparker has been chosen to complement the geophysical equipments pole, with now 2 subbottom profilers, 2 sparkers, and 1 magnetometer. The SIG sparker will be used for high-resolution subbottom profiling and to improve penetration due to the frequency range of around 1,000Hz.

Based in Busan, Underwater Survey Technology 21 is specialised in geophysical surveys, offshore support and resource exploration.
