

# Next Geosolutions Sells Out the Season in the Med

Next Geosolutions, the international geoscience and offshore engineering support service contractor, has recently been awarded three marine survey contracts from three different clients to be carried out in direct continuation in the Mediterranean Sea. The projects will involve a full range of marine survey disciplines including onshore, nearshore and offshore activities, most of which will be undertaken by using ROV-mounted sensors and tools.

The first one, which has just been successfully completed, encompassed multi-discipline survey tasks aimed at supporting a deep-water survey pipeline project, involving geophysical, environmental, archaeological and UXO survey and relocation activities.

## Eastern Mediterranean Sea

The other two missions are submarine cable route surveys providing topographical, geophysical, geotechnical and UXO survey activities in the Eastern Mediterranean Sea to be accomplished by using hull-mounted, towed and ROV-based equipment.

All three projects will be undertaken primarily from the group-owned high-specs DP2 multi-purpose vessel *levoli Cobalt*, which is permanently fitted with a state-of-the-art hangar-sheltered ultra-heavy duty Schilling ROV system skilfully operated by long-standing partner company [ROVOP](#). Onshore teams and nearshore spreads will complement operations locally. The three projects will keep this spread busy for the whole summer and autumn season in 2019.
