

# SBG +Services: Full Set of Technical Services around Inertial Sensors

SBG Systems has added to its catalogue a full set of technical services called the SBG +Services. Dedicated to surveyors as well as integrators, these services increase productivity by enhancing utilisation efficiency and bringing clever solutions to daily project challenges.

Choosing an inertial sensor is more than matching technical specifications. Professionals face other challenges such as training a new employee, ensure a production with a minimum interruption, or simply secure a budget during several years. To answer all these needs and even more, SBG Systems built a whole range of services: the SBG +Services.

SBG Systems offers [different ways](#) to get introduced to your SBG inertial sensors

- +Online Initiation: a two-hour session with an SBG Support Engineer using a remote-access software.
- +On Demand Training taking place at an SBG office or at the customer's place and
- +Intervention Day, a pre-paid day that could be used for training but also for installation or on-site support.
- Check & Calibration service including a quality check, a firmware update, cleaning, and if required, calibration in temperature and dynamics. A certificate is delivered with the sensor. It guarantees the quality of the sensor data for three years.
- +Back-up System service, giving the customer access to a replacement device if the original sensor requires a planned or unplanned factory return.
