

SeaView Systems SVS-603 Wave Sensor Deployments around the Globe

SeaView's SVS-603 Wave Height Sensor is enabling wave measurements on a wide range of buoy hulls worldwide. The SVS-603 is bringing wave measurements to a variety of platforms for which such measurements would have been impractical before the complete algorithms, small form factor and very low power consumption offered by the SVS-603.

The SVS-603 ships with a custom GUI environment that enables configuration of the sensor for a variety of output requirements and deployment situations. It also includes support for analysing the measured results from either the serial or USB output stream or the on-board SD card.

A few of the many deployments of SeaView's SVS-603 sensor are shown in the figure.

The results produced by this product offers a comprehensive set of wave summary statistics as well as raw data for scientific studies.
