

4D Ocean Maps Using Only Autonomous Platforms

4D Ocean was launched on the 3 April 2017 to provide autonomous survey services to the seabed mapping community. As a dedicated ASV, AUV and UAV operator they can supply the specialist service to companies so that they can take advantage of the performance efficiency, value for money and safety without having to have the in-house expertise or equipment investment.

Duncan Mallace, 4D Ocean's founder and managing director says "It is similar to the early days of multibeam sonars, everyone sees that autonomous survey is a great idea and the way ahead but are reluctant to invest or don't have the technological in-house capability. 4D Ocean has been formed to provide the systems and personnel and to drive the use of autonomous systems for seabed mapping."

[4D Ocean](https://www.4docean.com/) provide their autonomous survey services for hydrographic survey, coastal engineering, habitat mapping and pipeline/cable surveys on a global scale.
