

Ageotec Expands Production Capacity

As the result of growing business opportunities and ROVs success worldwide, Ageotec is to expand its production capacity through enlarging its existing production and laboratory areas in plant in Como (Italy). The new area will mostly be dedicated to the increased and renovated electronic laboratory which has been fitted out to the highest specifications and standards.

This will help improve technological innovation as well as efficiency of the production process since all mechanical and electronic technology is entirely developed inside the company. The entire facility include warehouse, R&D area, electronic laboratory, production and mechanical laboratory for assembling and customisation process and a well appointed test area with proof tanks and under pressure test systems.

The expansion of the technical and production capabilities is a response to the need to offer added value and state of the art products and services to customers with a view towards a further development over the long term.
