

# Applanix Launches its Next Generation POS AV

Applanix announced the launch of its next generation POS AV system. The Applanix POS AV version 5 is an integrated turnkey system designed for fast, accurate direct georeferencing of aerial imagery and airborne sensor data.

Key attributes of the new system include, improved real-time operation, automatic redundant data logging, and enhanced positioning performance, a result of the latest in Trimble L1/L2 GPS receiver technology.

In addition, POS AV version 5 has been configured to seamlessly integrate with the Track' Air Flight Management System to provide an automated airborne mission control capability, designed to reduce the operational costs associated with aerial surveys. The POS AV / Track' Air combination streamlines the preparation and completion of airborne missions using an arrangement of specially developed software and hardware tools.
