

Bespoke Survey Solution for Sea Bed Application

4Geo, the GeoMax dealer in Germany, and software expert Keven Corazza have worked closely with the LÃ¼beck Port Authority (Germany) to create a solution specifically designed to fulfil their specific requirements for a marine application. The system, created by GeoMax, connects a GPS antenna and sonar with specially created X-Pad software.

Sonar is used to collect data from the harbour bed. The software offers a visual record, whilst also incorporating the accurate positional information provided by the GPS antenna. When the team took a boat out to test the X-Pad sonar module for the first time it proved 100% successful.

The GeoMax approach to creating bespoke solutions, is helping a wide range of geoprofessionals to maximise the impact of advances in technology and realise their projects in record time.
