

# C-Nav updates C-Navigator display unit

The C-Nav GPS Division of C & C Technologies has updated the popular C-NaviGator, a GNSS Control and Display unit. The updates include a new high-performance, touch screen version featuring a 10.4 inch easy-to-read color LCD flat panel display.

This new touch screen panel PC, combined with C-NaviGator's intuitive and easy-to-use interface, provides trouble-free operation. Software upgrades are handled via a simple interface utilizing an included C-Nav USB Thumb drive. On screen help is also available and is updated automatically with the software.

The system can be used to configure C-Nav GNSS receivers and to monitor real-time quality, performance, and accuracy information. The integrated 1 GHz fanless Pentium class processor runs Linux and several I/O connectors. This enables the operator to monitor more than one GNSS receiver and still output data to external devices with different data requirements.

This system is packed into an attractive 34 by 26 by 8 centimetres package weighing only 4.5kg. The system operates on 12VDc, and provides a variety of mounting options to suit most customers needs.
