

C6 Multi-Sensor Platform Digital Data Output

The submersible C6 Multi-Sensor Platform integrates up to six field-interchangeable Cyclops-7 fluorometers and/or turbidity sensors. Now the C6 is available with digital data output for integration with third-party platforms. The C-Soft Windows-based user interface allows for intuitive calibration, data logging, and data management. And the digital data output allows for easy integration with existing water monitoring systems such as CTDs, dataloggers, vessels of opportunity and buoys.

Deployable up to a depth of 600 metres, C6 booster cables allow RS232 communication at depths greater than 5 metres. Customers who already own a C6 can download a free software upgrade from the Turner Designs website.
