

CMS-Geotech Surveying for Galloper Project

Lowestoft-based multipurpose vessel *MV FlatHolm* finished off a busy year in 2016 with a successful charter to James Fisher Marine Services, undertaking a variety of service activities in connection with the Galloper Offshore Wind Farm during November and December. The Galloper project was busy, last year, with turbine foundation preparation and *MV FlatHolm* provided daily cover, making sure the site was clear and checking for hazards and obstructions which might have hindered operations with the scour protection rock placement work.

Being based in Lowestoft, UK, [MV FlatHolm](#) was able to be on standby for any situation which might require immediate deployment, offering efficient and cost effective support whenever needed. The versatile and popular 24m vessel also completed operations with the deployment of two Triaxys Waverider buoys before the planned charter conclusion.
