

dKart Hydrographer 2.1

HydroService AS has released newly developed post-processing software, dKart Hydrographer 2.1. This new tool extends the dKart Office suite of tools that already includes software for synchronised production and maintenance of all nautical chart products, S-57/ENC and paper-based.

The new software provides advanced functionality for processing single- and multi-beam survey data, solving all the necessary hydrographic tasks (errors detection and elimination, data thinning, 3D sea bottom modelling, depth contours generation, manual data editing and S-57/ENC creation from processed/raw data, etc.).

The new software is capable of working with small, medium and large amounts of data; the system supports a variety of interfaces and data-exchange formats and is easily integrated into any cartographic production line.
