

Euronav Releases Navionics Platinum+ Support in seaPro

Euronav have introduced support for Navionics Platinum+ charts in their seaPro navigation programme. With the inclusion of Navionics Platinum+ the seaPro user can view the brilliant panoramic photographs, high resolution top down photographs and enhanced port services information all included in the Platinum+ chart format.

seaPro's advanced cartography engine will allow the simultaneous use of Navionics charts on a hardware plotter and seaPro. This is not only convenient but also represents a significant cost saving to the navigator as they only have to buy one set of charts.

The support for Platinum+ adds to the already extensive range of chart formats available in seaPro which includes 3 vector formats and over 8 raster formats which makes seaPro one of the most compatible chart plotters available today.

seaPro has been the UK's top navigation software since 1993 and features tidal passage planning, weather overlays, RADARpc support, real-time GPS positioning and many other powerful navigation tools.
