

EUROSEISMIC

In the framework of the EU-financed project EUROSEISMIC a central metadatabase for geophysical data derived from marine seismic surveys for the European Seas has been generated and developed. EUROSEISMIC established a metadatabase on the Internet for marine geophysical survey data held by the marine departments of the European geological surveys and their project partners.

It consists of the following functionalities:

- Data-entry with on-line data import modules
- On-line data edit
- Data quality-control
- Data-retrieval by means of a map interface in combination with numerical extended search (allowing searches on mandatory and/or optional metadata fields)
- Data export
- GIS-based geographical interface for navigation and presentation
