

Geotechnical Services for Alpine Ocean Seismic Survey

Alpine Ocean Seismic Survey, the US subsidiary of UK-based Gardline Group, has expanded its marine data collection offerings with the addition of geotechnical services. Research teams will leverage Gardline Geosciences' global experience, equipment, and data-processing technologies to offer cone penetration testing (CPT), offshore heave-compensated drilling and seabed sampling for projects ranging from nearshore surveys to offshore efforts in depths of up to 3,000 metres.

Andy Barwise, business development director, Gardline Geosciences said that Gardline's extensive experience, combined with Alpine's localised data acquisition knowledge, relationships with state and federal agencies, and work on a wide range of high-profile marine projects, enables the company to offer North American clients geotechnical services.

Robert Mecarini, president, Alpine Ocean Seismic Survey adds that the suite of geotechnical offerings joins Alpine's existing portfolio of geophysical, hydrographic, oceanographic, environmental, and positioning services.
