

HyDrone Delivery for Survey Solutions

Following the HyDrone presentation at the recent GeoBusiness 2016 exhibition in London, UK, Survey Solutions (Scotland) has taken delivery of its first remote-controlled platform for hydrographic data acquisition. The platform will join its survey equipment hire fleet and will be used in conjunction with Trimble GPS and robotic total station systems.

Commenting on the addition to the hire fleet, Richard Mason could see a wide range of applications for the HyDrone system for inland hydrographic surveys of canals, rivers and lochs throughout Scotland. In response to feedback from the show, Ohmex has provided Trimble with updated interface files to incorporate the SonarMite BTX and DFX echosounder unit seamlessly within the popular Trimble Access data collection software. The files are available to download from the Trimble DocuShare website.
