

# IMCA Accreditation for Osiris Marine Servicesâ€™™ ROV Capabilities

Osiris Marine Services, UK, has achieved the International Marine Contractors Association (IMCA) accreditation for the Remote Systems and ROV Division. The IMCA accreditation will enable the company to expand and strengthen its capabilities, whilst continuing to offer the same service that its customers are familiar with.

Osiris supplies an array of subsea engineering services on a global basis to both the onshore and offshore sectors. Its ROV capabilities began nearly a decade ago, and since then have grown to provide a wide range of equipment from inspection-class ROVs capable of flying down pipelines with an internal diameter of as little as 190mm, to work-class underwater ROVs that can operate powered tools and carry cable finding equipment to depths of up to 1,000 metres. The company has also invested in a Launch and

Recovery System (LARS) and a Tether Management System (TMS) to enable them to utilise their assets in a wider range of projects.

IMCA is the internationally respected trade association representing offshore, marine and underwater engineering companies. The Remote Systems and ROV Division of IMCA assists ROV operators in achieving high levels of safety and efficiency, and this accreditation is in recognition of Osiris meeting these high levels.
