

# iXBlue RAMSES for STR

The iXBlue RAMSES has been selected by Subsea Technology and Rentals Ltd (STR), UK, as a solution to deliver precision navigation and smooth, drift-free positioning for a range of subsea operations whilst offering significant time savings over alternative solutions. iXBlue's RAMSES is a self-contained system that can operate either as a stand-alone positioning solution or in conjunction with iXBlue inertial navigation systems to provide sparse array functionality.

Requiring no top-side components, RAMSES can be quickly and easily deployed in new or existing fields, operating with either iXBlue or third-party transponders.

STR have already received delivery of the RAMSES technology, are fully trained and ready to support their clients across the globe with immediate and simple mobilisations.

Scott Johnstone, STR's managing director, stated RAMSES will enhance STR's ability to provide advanced technology fast.
