

Kongsberg EN250 for HOV

After the delivery of two Kongsberg hydrographic systems for HOV vessels, Bennex Holland BV has now received an order for a Kongsberg EN250 single beam echosounder with spare parts and an in-house developed interface for connecting four 50kHz transducers with special interfacing to the onboard computer systems. This special interface contains data information and indicates which transducer is connected to the echosounder system. For many years Bennex Holland BV has been developing special interfacing for several applications inside acoustic systems for the RDN. The new system will be delivered in October 2003.
