MARS Lidar Data Management Software

The GeoSpatial Solutions (GSS) division of Merrick & Company has made the new version 6.0 Merrick Advanced Remote Sensing (MARS) software suite available online. Geospatial users interested in evaluating MARS may download either the 32-bit or 64-bit software installers directly from the Merrick website.

Developed to support users working with very large light detection and ranging (Lidar) datasets, the MARS software suite is a robust, production-grade Windows application designed to manage, visualise, process, and analyze Lidar data. Boasting powerful visualization capabilities and excellent data processing performance, MARS also supports high-resolution orthoimagery, GIS/CAD vector data and hyperspectral imagery.

Parties wishing to utilise the free, 30-day MARS trial version should complete the download information form on the website in order to access the free trial version. A valid e-mail address is required to receive the version 6.0 evaluation license.
