

# New Generation of EIVA NaviPac Survey Navigation and Positioning Solution

The fourth generation of EIVA NaviPac is to be launched at Oceanology International 2016 on 15 March 2016. Visitors to the EIVA stand will be able to get a demo by the company's NaviSuite experts and try out the software themselves. NaviPac 4 is the result of a major overhaul of the survey navigation and positioning software, introducing both new and improved features, especially for offshore survey and construction operations.

The strategic aim of all NaviSuite development activities sums up what the launch of NaviPac 4 offers users, as it allows them to eliminate the number of solutions required to carry out survey and construction operations; standardise their setup by using the same software for different types of operations; simplify and automate the operation workflow to reduce operator time.

## Visualisation and Processing

NaviPac 4 brings visualisation and processing features from EIVA NaviModel, the NaviSuite solution for 4D modelling and visualisation. NaviModel has proven its worth as a valuable tool to many of the major operators in the offshore industry. By bringing these into play in NaviPac 4 as well, the solution takes a big step up in terms of technology, not least by offering a native, real-time 3D engine.

Other features in NaviPac 4 include amongst others a new user interface, new configuration tool and new LiDAR navigation capability.

## More New Versions

At the same time of the NaviPac 4 launch, EIVA also releases new versions of the NaviScan, NaviEdit, NaviModel solutions as well as the Catenary module.

Stop by stand D500 to celebrate the launch at a reception at 11AM on 15 March and to see and try NaviPac 4 in action. Visitors are welcome to bring their own data sets to play with.
