

New Generation Thales Marine Survey Software

Thales has introduced a new generation of marine survey software. The new software is developed as a fully integrated suite of applications covering real-time offshore data acquisition, processing and charting for the oil and gas, construction and hydrographic survey industries. The new Pelagos integrated software suite enables Thales GeoSolutions to offer its marine survey clients faster access and turnaround of data, increased quality control and improved information content, all under a common architecture with a consistent Graphical User Interface (GUI) format for every module in the suite. Easy to use, the Pelagos suite integrates tightly to give the user total control and access to the data, from initial acquisition through to delivery to the client. Software applications initially covered in the Pelagos suite include Pelagos Acquisition, Pelagos Digital Video System, Pelagos Quality Control, Pelagos Data Processing System and Pelagos Chart.
