

New HP-capable Receiver

OmniSTAR has introduced its latest 8400HP GPS receiver. After start-up this receiver works instantly in DGPS VBS mode and switches to HP once an accuracy of 30cm has been reached. The 8400HP uses internal batteries that last up to 10 hours, making the receiver highly suitable for the GIS market. A 32MB internal memory for storage of either position or raw measurements, or operation in RTK mode is available as an option.
