

New Tide and Wave Recorder

RBR Ltd. has introduced the TWR-2050, a new compact submersible tide and wave recorder. The unit, with both burst modes and averaging, is capable of recording tide and wave data according to a flexible user-programmable deployment scheme. Low-power operation and a large internal flash memory provide characteristics for extended deployments. A simple connection to an RF modem or cellular link also makes this suitable for real-time monitoring of sea-state conditions.
