New Version dKart Office

HydroService AS has released newly developed post-processing software, dKart Hydrographer 2.1. This tool extends the dKart Office suite of tools that already includes software for synchronised production and maintenance of all nautical chart products, S-57/ENC and paper-based. The new system provides advanced functionality for processing single and multi-beam survey data, solving all the necessary hydrographic tasks (errors detection and elimination, data thinning, 3D sea-bottom modelling, depth contours generation, manual data editing, and S-57 ENC creation out of processed/raw data, etc.).
