

Offshore Geochemical Survey Sales

EGS (Asia) Ltd and W. L. Gore and Associates, Inc. have signed a joint sales agreement designed to provide advanced offshore geochemical survey services. The GORE Exploration Survey is a proven method for the collection, analysis and data interpretation of hydrocarbon microseepage, with the ability to detect and quantify over ninety compounds (up through C18). The survey enables exploration geologists to identify formation-specific geochemical signatures of petroleum production and map these signatures across both onshore and offshore exploration sites. EGS will provide vessel logistics and seabed core sample collection services for Gore Exploration Surveys. The alliance will provide customers with an easy, efficient and economical means of gathering valuable surface geochemical data.
