

Port of Brisbane Corporation Purchases Reson Multibeam Echosounding Equipment

The Port of Brisbane Corporation has recently upgraded their hydrographic surveying capability with a Reson Seabat 8125, POS MV V4 and QINSy data collection and reduction software. The equipment has been installed on their 16m mono hull vessel *Jim Peel* and results to date have been excellent. To complement this package PBC has also invested in Terramodel and Fledermaus visualisation software. The system was put to good use during a recent dredging campaign in Moreton Bay involving the Boskalis dredger *Cornelus Zanen* deepening a section of the entrance channel from 14m to 15m.
