

SeaZone in South America

SeaZone Solutions, UK, has expanded its data coverage to over 40% of the world's ocean and continues to expand into new geographic areas. The most recent addition is Charted Raster covering various locations across the waters adjacent to South America.

Inspired by feedback from SeaZone customers, this follows the recently acquired mapping coverage of Canadian and French waters and includes content from the former French colonies. The timely delivery of new product content in the HydroSpatial Base marine mapping product has enabled some users within the growing marine-mapping user group to win major contracts in these areas of new product coverage.

The growth in oil exploration, marine renewable energy generation and sub-sea cable laying and management, alongside more traditional marine space uses including shipping, areas of military practice, fisheries and leisure activities, finds equitable and consistent marine spatial planning to be a high priority for all marine space user groups. SeaZone is developing intuitive products and services to enable planning and management of marine areas into the future.
