

Sediment and Soil Characterisation Systems for North America

MacArtney entered into a partnership with dotOcean for North American markets. The agreement provides MacArtney's customers via its subsidiary MacArtney Inc. access to the range of dotOcean sediment and soil measurement products.

The products included in this partnership include the GraviProbe, a free-fall impact instrument analysing soil layers during intrusion; the deep sea GraviProbe, which captures high quality geotechnical profiles of mud and soil layers up to 5,500m water depths; the DensX, an in-situ, direct measurement mud density method using safe X-ray technology and an automated winch; and the iCone, a manual profiler that analyses underwater soil layers in small waterways and rivers.

Relationship in Europe

The partnership has become reality in continuation of the partnership already established in Europe. Promotion and sales activities in the North American markets will be handled by the five regional MacArtney operations and consist in organising product presentations and in-situ demonstrations to call attention to the products available with the two business partners who expect a considerable boost to future activities.
