

Stage II for Tennet Offshore UXO Survey Programme

As result of the Unexploded Ordnance (UXO) threat identified from successful route survey for Tennet Offshore, MMT (Sweden) is to perform stage II in the marine UXO survey programme for the HelWin 2 project.

The magnetometer targets and sidescan sonar targets that were picked from geophysical survey (stage 1), require further investigation. The purposes of the marine survey in stage II are to confirm the nature of the objects causing anomalies induced by ferrous metal objects on the Earth's magnetic field. It is also to be determined whether the location possesses an UXO risk to the cable lay operations and to identify and advise Tennet's project management on eventual new route opportunities.

MMT is happy with the continued confidence from Tennet Offshore and looks forward to working with them again.
