

Teledyne Benthos Announces Coastal Acoustic Release Technology

Teledyne Benthos has announced the introduction of its coastal release technology. New products include the value-priced Releaseit Deck Unit and dunking transducer, as well as the R-500 Coastal Acoustic Release.

The [Releaseit](#) Deck Unit enables basic communications and acoustic release functionality when used with any of Teledyne Benthos R-Series Acoustic releases deployed in shallow-water environments. Releaseit offers budget-conscious customers an attractive alternative topside unit that allows for highly-reliable basic coastal operations. When paired with the R500 Coastal Acoustic Release, the combined system delivers a lower-cost turn-key option for shallow-water applications in up to 500 metres water depth.
