

Teledyne CARIS Launches Complete Workflow Software

Teledyne CARIS, a Teledyne Technologies company and leading developer of marine mapping software, has announced the release of Onboard360 featuring CARIS Collect. The newly released software delivers a seamless flow of data into the Ping-to-Chart workflow. When combined with the Onboard360 Process module, logged data is imported and processed automatically allowing near real-time and remote quality monitoring of in-progress surveys.

The CARIS Collect module provides simple and effective data collection for the most common sonar and Lidar systems in the market. CARIS Collect was designed with an intuitive user experience for ease of integration and simple user adaptation, minimizing the effort required to implement new software.

Vice-president of sales and marketing Andy Hoggarth commented: "We are pleased to offer our customers the ability to collect with confidence using [CARIS Onboard360](#). Our Ping-to-Chart solution is now complete, with the inclusion of the simplest acquisition software available for hydrographic survey operations whilst providing significant reductions in ship-to-shore turnaround times."

Available as a perpetual or SaaS annual licence, Teledyne CARIS has made Onboard360 the most cost-effective acquisition software package on the market.
