

# The Swedish Hydrographic Office Chooses CARIS

The Swedish Maritime Administration (SMA) has chosen CARIS Hydrographic Production Database (HPD) as the new system to meet the Hydrographic Office's current and future requirements. With HPD, the Hydrographic Office will have a system for the management of spatial data and the efficient production of paper and electronic charts.

Efficiently and securely migrating data and transitioning the work force to a new system while continuously ensuring safety at sea, is vital for the Hydrographic Office, who represents Sweden as a member of the International Hydrographic Organization (IHO).

The delivery of HPD includes a comprehensive training plan ensuring that the twenty operators who will use HPD gain a good understanding of data management, allowing the

continued production and maintenance of more than 100 paper charts and 600 ENC's.

The Swedish Maritime Administration is responsible for accessibility and safety in the Swedish waters. Services include, but are not limited to, pilotage, icebreaking, maritime traffic information, maritime and aeronautical search and rescue and hydrography.

HPD offers an integrated suite of products that can manage data in a seamless database, providing a multi-user environment for efficient data and chart production. Products such as S-57 ENC's and IENC's, S-57 AML's, paper charts and nautical publications can all be created with the system as well as GIS exports for further data analysis, distribution and discovery.
