

# Three Innovator ROVs for Sonsub

The ROV fleet of Sonsub in the UK has been augmented with the arrival of three brand new latest generation Innovator 250s. Designed and built in-house by Sonsub's own research and development team, these heavy construction class systems are capable of the highest level of activity, providing unrivalled power and control for deepwater operations, whilst retaining the now established advantages of the Innovator class.

As well as an upgrade to 250hp power system, these new ROVs come with state-of-the-art heavy weather Launch and Recovery Systems (LARS) to enhance operational capability in harsher conditions, plus new fully electric umbilical winches featuring active

heave compensation, high speed deployment and quieter operating conditions.

The vehicles are being deployed on Sonsub's own fleet of subsea construction vessels, with Innovators 21 and 22 already onboard the Bourbon Pearl and Normand Cutter respectively, and Innovator 23 planned for the Far Samson later this year.
