

Triton Elics International Announces Processing Suite for Benthos C3D

Triton Elics International yesterday launched C3Dsuite, a software package for collecting and processing sidescan and bathymetry data from the Benthos C3D Sonar Imaging System. The sonar can simultaneously collect co-registered bathymetry and side scan sonar with a single system. The C3D suite has acquisition and processing capabilities tuned especially for the C3D. The package includes enhanced Isis software which can handle the two data types. A window is used to display a 3D view of the side scan data draped with the bathymetry, this is updated in real time as the data is acquired. The C3D package also includes TEI's RTMosaic, BathyRT, BathyPro and DelphMap modules.
