

# Ultra-high Frequency Side-scan Sonar

EdgeTech has recently developed a new 600/1600 kHz frequency set for their popular 4125 Side Scan Sonar System. This new frequency combination is part of a variety of enhancements that have recently been made to the 4125.

The new 600/1600 kHz towfish was designed specifically for search & recovery, port security and small target identification applications. The customer can now choose between this new frequency offering or the 400/900 kHz 4125 towfish, which is the perfect tool for shallow water survey applications.
