

Underwater Navigation Training in Europe

Teledyne RD Instruments (TRDI, USA) is to host a two-day training seminar focused on the Doppler Velocity Log (DVL) technology. DVLs are used extensively onboard underwater platforms and surface vessels to provide precision navigation capability.

All current and potential DVL users are encouraged to attend this event to expand their working knowledge of their DVL and its application to their underwater platform.

This training will be hosted in Antibes, France, on 19 and 20 June 2014. Full details and online registration are available from [Teledyne RDI's website](#).
