

Variety of RBR Products Available for Lease

RBR, Canada, has announced that its RBR Atlantic office now offers a variety of RBR products for lease. RBR Atlantic's lease pool not only consists of oceanographic data loggers, but also includes the RBR thermistor string (XR-420), salinometer (MS-315e), and inductive mooring line modem (MLM).

RBR appreciates that there are many elements involved in arranging a successful project and at times budgets are limited or project funding can be delayed. Leasing of instrumentation is one means of resolving this. Leasing provides direct access to the latest technology without high capital costs. To further assist with the technical aspects of instrument deployment, RBR Atlantic also offers in-field and field-planning services.

The instrumentation lease period is a minimum of two weeks, but with lease-to-buy options, lease periods of a year or longer might be more suitable. With RBR data loggers, customers also have their choice of various sensor combinations – temperature, depth, pH, DO, conductivity, fluorometer, etc. The list is seemingly endless. See RBR's website for additional sensor information.

Doug Schillinger, oceanographer with RBR Atlantic, stated that having been involved in many projects over the past 15 years, he knows how valuable 'just one more' instrument can be. RBR Atlantic's lease pool provides its customers with access to a full range of instruments to complement or complete project needs.
