

Versatile ROV

Mariner Underwater Electronics has launched its newest electric powered ROV, the Ippodamus. It has a depth rating of 800 metres which can be increased considerably for custom-made orders. It has been designed to be used for professional inspection and survey operations (observation, inspection, tunnel penetration etc).

The Ippodamus can carry sensors as well as small manipulators, making the vehicle a very useful tool in the hands of experienced and professional operators. It has a high resolution colour camera with internal green laser and a video overlay system.
