

Water Framework Directive

OSIL is offering equipment packages especially for the purpose of coastal survey and monitoring work associated with the Water Framework Directive. Each package includes a Guildline MiniBAT sensor platform and a selection of key sensors for coastal sampling. The MiniBAT forms the core of the package and is perfectly designed for coastal sampling work, allowing undulating, constant, or fixed depth off-the-bottom profiles to be collected in depths of up to 60 metres and at speeds of 2-10 knots. In addition, the MiniBAT is lightweight and compact, enabling deployment from small survey vessels. The OSIL coastal monitoring package includes a choice of multiparameter sondes for CTD, dissolved oxygen, pH, chlorophyll and turbidity.
