

Introducing Navigate - the Nautical SmartChart

What is the core role of a hydrographer? To map the seafloor? Provide a precise position on the water? Some may believe it is to play with lots of expensive toys on boats, while colleagues are stuck in the office. While all those answers may be correct, I am asking about the *core* role of a hydrographer. I would suggest that it is collecting *data* to provide *information* that companies, clients and consultants rely on to make *educated* and accurate *decisions*. This is where our value as a professional service is demonstrated. However, here is another question - how do we present that information and, more to the point, could it be *better*?
