

# Transitioning to Remote Hydrography: Challenges and Opportunities

Hydrography as we know it is brutally changing. The current pandemic made it very difficult to simply put to sea Research Vessels, the blue economy is booming, as is the need to keep surveyors out of harm's way and grant easier and less expensive access to data and assets to most.

In this webinar, iXblue looks at how remote hydrography and the use of autonomous platforms such as DriX Unmanned Surface Vessel (USV) respond to these new challenges. Using our achievements and developments as a case study, we will show the audience how the industry can conduct that shift towards remotely controlled operations and how it is bringing a greener, safer and more efficient way of conducting hydrographic surveys.
